EXP:07 – USER, ROLES AND PERMISSIONS

1. Aim

To configure and understand users, roles, and permissions in Zoho Creator for the Internship Management System, and to examine how access can be organized for different users of the application.

2. Procedure

1. Open the Internship Management System in Zoho Creator and navigate to Settings.
2. Select User Permissions to view the available permission profiles.
3. Open the Roles tab to view the role hierarchy configured for the application.
4. Review the existing roles: CEO, Admin, and Student.
5. Open the Zoho Creator Users page to review users, their email addresses, and account status.
6. Record the configuration using screenshots and verify that the displayed settings match the application.

3. User Permissions

The User Permissions page displays two permission profiles: Read and Write. The displayed descriptions state that Read provides read permission for all components, while Write provides write permission for all components.

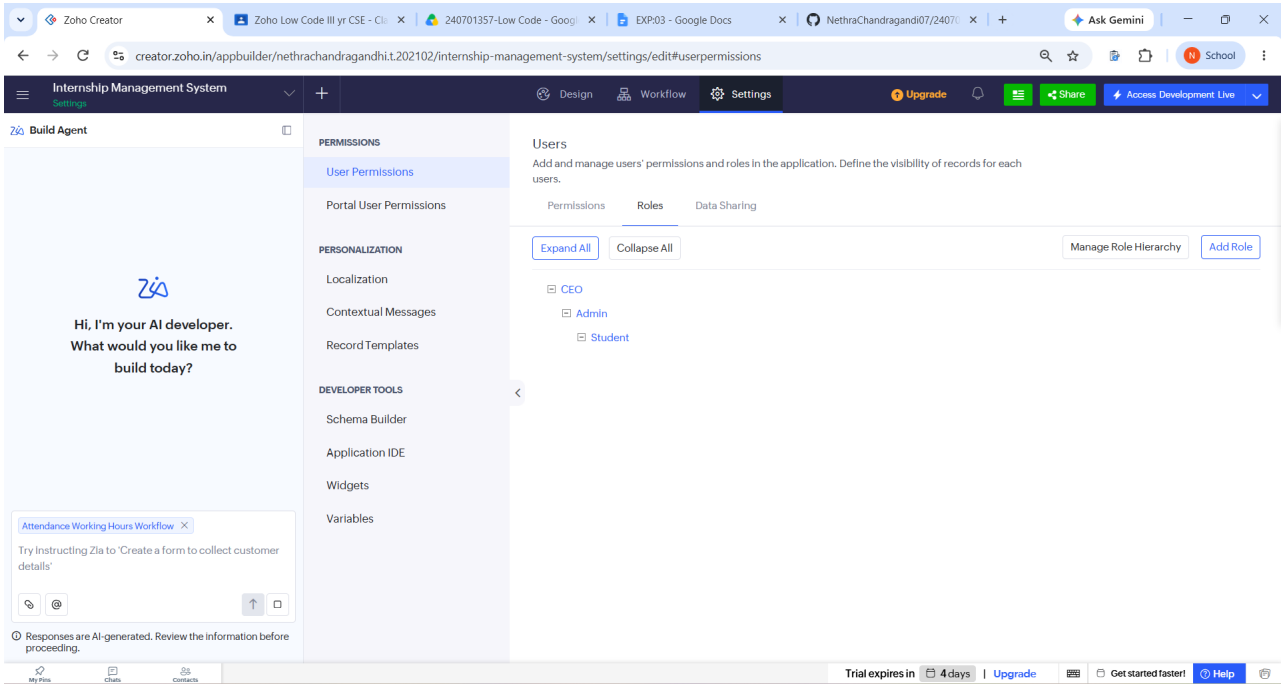

Figure 3.1: Read and Write permission profiles in Zoho Creator

4. User Management

The Zoho Creator Users page lists the users configured in the account, along with their email addresses and statuses. The supplied screenshot shows four user entries, each marked Active; one entry also shows an invitation-related activity label. This screenshot documents account-level user management and does not by itself confirm that every listed user has been assigned a particular application role.

5. Permissions and Access Overview

In this application, roles provide a way to organize users by responsibility, while permission profiles define the type of access available to application components. For an internship management application, access can be planned according to responsibility—for example, administrators managing records and students viewing relevant internship information. The exact access available to each role should be verified in the Permissions and Data Sharing settings before claiming that restrictions are enforced.

6. Result

The existing user permission profiles, role hierarchy, and user list were reviewed and documented with actual screenshots from Zoho Creator. The visible role hierarchy consists of CEO, Admin, and Student, and the visible permission profiles are Read and Write.

7. Conclusion

This experiment demonstrates where users, roles, and permission profiles are managed in Zoho Creator. It also highlights the importance of verifying role assignments and data-sharing rules so that users can access only the information and actions appropriate to their responsibilities.
